Enhancing the resilience of coastal wetlands to promote sustainable livelihoods in a changing climate

Coastal wetland ecosystems provide a wide range of goods and services. They protect inland areas from high waves, storm surges and tsunamis. They provide wood, fish and also store huge amounts of carbon.

Yet low-lying coastal wetlands are among the most vulnerable landscapes to climate change, sea-level rise and land-use change for economic development.

Join us to explore how we can balance conservation and development through restoration and other innovative initiatives to enhance the resilience of wetlands and minimize damage to local livelihoods and the environment.
